

# Numara Device Manager

## Protect Your Business

With the profusion of removable devices such as USB drives, cell phones, portable hard drives, and music players, intentional or unintentional data leaks are inevitable. Most organizations use firewalls and antivirus software to prevent against external threats; however few recognize the need to protect against internal threats. Loss of sensitive information such as customer data, personal identification information, corporate financial data and other intellectual property is expensive to recover. The cost of data recovery, notifying customers, and ultimately the loss of business can be detrimental to any organization. Numara® Device Manager helps you guard against these damaging consequences.

### Highlights

- Protect against data theft and loss
- Control and manage all removable devices on your network
- Enforce security policies
- Ensure data security
- Control USB Devices
- Flexible Rule Configuration
- Identify and authorize specific media

## Reduce Exposure with Controlled Device Management

Data loss prevention is a critical part of an organization's IT security strategy. Data leakage or privacy breaches can cripple any organization. Numara Device Manager protects your business by minimizing the risks associated with unauthorized use of prohibited devices, such as USB drives or external hard drives. By allowing you to quickly define policies that specify which devices are explicitly enabled or disabled, Numara Device Manager ensures compliance and reduces the manual effort of managing, or resolving issues caused by, unsanctioned devices.

## Flexible Security Policies

Numara Device manager provides flexible device usage policies to ensure confidential information does not leave your environment. Reliably managing both inbound and outbound communication from your endpoints ensures that only authorized removable storage devices can be utilized on corporate computers. This prevents leakage of sensitive information, whether malicious or careless in nature. Usage policies, known as operational rules, can be applied to users or devices individually or on a group level. As a result, Numara Device Manager enables you to quickly establish and enforce data protection with minimal effort.

## Save Time with Centralized Control

Numara Device Manager enables IT professionals to centrally control uploading and downloading activity from Bluetooth devices, CD/DVD drives, firewire devices, floppy drives, modems, wireless and USB devices. The Numara® Asset Management Platform provides an interface to control and log all peripheral device events. If data leakage is suspected, the IT administrator can create a usage policy and apply it to single or multiple devices within a single, central location. Event logs can track devices or groups of devices.

## Many Challenges. One Solution.

Numara Device Manager is one part of a fully integrated line of IT asset management solutions that make up the Numara Asset Management Platform (NAMP). Each NAMP product automates and streamlines a specific IT asset management challenge to help you reduce costs and improve service levels. Built from the ground up as a modular, yet integrated system, the NAMP product line provides a single, unified solution to simplify a diverse set of complex asset management needs.

All NAMP products run on a centrally managed framework and leverage one console, one database, one set of operational rules, one reporting engine, and one multi-functional agent. As a result of this integrated approach, you can easily snap in individual asset management products to fit changing needs without the overhead and expense of implementing a whole new solution, which means faster ROI and a lower total cost of ownership.

## Scalable Architecture, Easy to Manage

Numara Device Manager and all NAMP products employ a highly flexible, multi-tier architecture that can serve any size organization, small or large, and easily scale to manage thousands of nodes in large geographically distributed organizations.

Built-in configuration tools and a graphical administrative console allow you to dynamically adapt to a changing environment by expanding or reconfiguring your deployment in minutes without programming or scripting.

## Supported Platforms
